## ABSTRACT OF THE DISCLOSURE

10

15

An objective of the present invention is to provide a slide type portable information terminal having a favorable internal packaging efficiency and a compact shape. A first body and a second body, each having a wedge shaped outer appearance, where a dimension in the depth direction gradually becomes thinner from one side to the other side in the width direction, are slidably coupled via a slide mechanism to constitute a body. As for the body, when the first body and the second body are overlapped, a part of the second body having the thickest dimension in the depth direction is arranged on one side of the first body having the thickest dimension in the depth direction is arranged on body, and a camera unit is arranged in the portion with thickest dimension in the depth direction of the first body.
